Prediction of poor neurological outcome in comatose survivors of cardiac arrest: a systematic review

Claudio Sandroni^{1,2}, Sonia D'Arrigo^{1*}O, Sofia Cacciola¹, Cornelia W. E. Hoedemaekers³, Marlijn J. A. Kamps⁴,

Conclusion: In comatose resuscitated patients, clinical, biochemical, neurophysiological, and radiological tests have a potential to predict poor neurological outcome with no false-positive predictions within the first week after CA. Guidelines should consider the methodological concerns and limited sensitivity for individual modalities. (PROSPERO

Prediction of good neurological outcome in comatose survivors of cardiac arrest: a systematic review

Take-home message

In adult patients who are comatose after return of spontaneous circulation (ROSC), the following indices predict good neurological outcome (no, or mild to moderate neurological disability) with > 80% specificity and > 40% sensitivity in most studies:

- Specificità elevata, ma sensibilità piuttosto bassa.
- Inoltre: non patient-centered, basati su CPC e mRS.

ERC and ESICM guidelines 2021: post resuscitation care.

• <<(CPC, mRS, GOSE)... are **not** sufficiently sensitive to capture the problems that many of the survivors experience>>

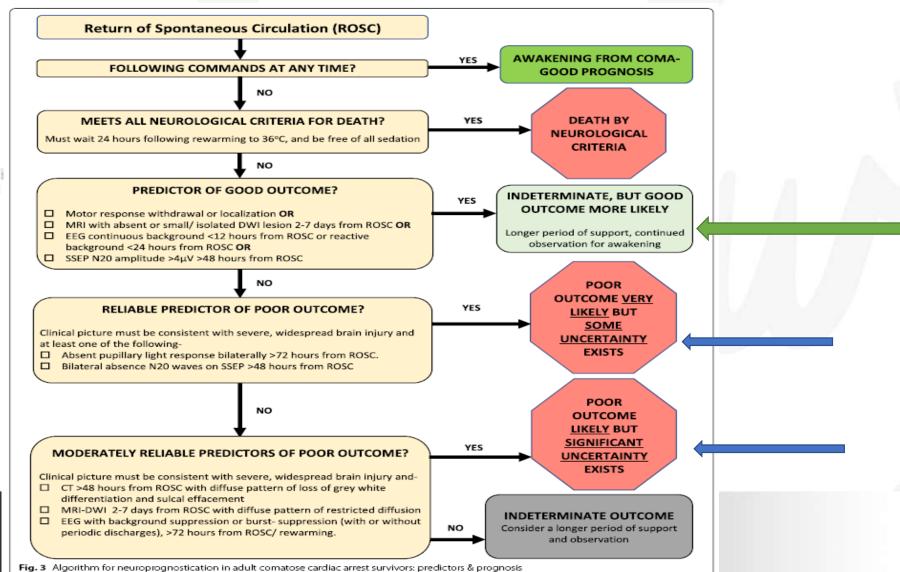

Decidere cosa fare potrebbe essere problematico anche se sono presenti i predittori di esito...

Partiamo dalle basi. Qual è l'obiettivo condiviso?

LA RIVOLUZIONE DEI SISTEM

• Il solito: fare il meglio per il paziente.

LG ILCOR 2020: <<Clinician(s) must take care to ensure that any decision is in the individual's best interest>>.

Solo questo. Solo questo.

Cos'è un poor outcome <u>per il pz</u>?

LG ILCOR 2020 (Ethics of resuscitation and end of life decisions): << defining an unfavourable outcome is challenging. The cut-off of a CPC 2 may translate to a spectrum of functional outcomes. Moreover, the value of an outcome to an individual will likely be specific to that person>>.

European Resuscitation Council Guidelines 2021: Ethics of resuscitation and end of life decisions

Epidemiological data provides information on outcome at the population level. 217,285,286 Outcome for an individual is influenced by patient-level factors such as age, co-morbid status, and aetiology of cardiac arrest. As such, predicting outcome at an individual patient level is challenging. Key challenges for clinicians are effective communication of uncertainty about the likely outcome if an individual has a cardiac arrest, and to ensure that their personal values and preferences do not influence the patient.

Guidelines for Neuroprognostication in Comatose Adult Survivors of Cardiac Arrest

Neurocrit Care (2023) 38:533-563 https://doi.org/10.1007/s12028-023-01688-3

Prediction models

Out of hospital cardiac arrest (OHCA): There is insufficient evidence for a recommendation

Cardiac Arrest Hospital Prognosis (CAHP): There is insufficient evidence for a recommendation

When counseling family members or surrogates of comatose survivors of in-hospital cardiac arrest, we suggest the Good Outcome Following
Attempted Resuscitation (GOFAR) clinical predictionmodel alone not be considered a reliable predictor of poor functional outcome assessed at
3 months or later (weak recommendation; moderate quality evidence)

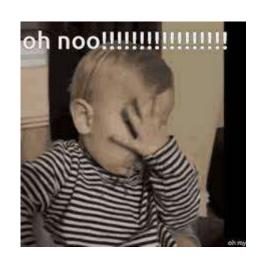

Eddai. Possibile?

PREDICTING LONG-TERM COGNITIVE IMPAIRMENTS IN SURVIVORS AFTER CARDIAC ARREST: A SYSTEMATIC REVIEW

Astrid GLIMMERVEEN, MSc^{1,2}, Marlous VERHULST, MSc^{1,2}, Jeanine VERBUNT, MD, PhD^{3,4}, Caroline van HEUGTEN, PhD⁵⁻⁷ and Jeannette HOFMEIJER, MD, PhD^{1,2}

J Rehabil Med 2023; 55: jrm00368

In conclusion, despite unequivocal recommendations on early screening for identification of patients at risk of long-term cognitive impairments after cardiac arrest, evidence on the value of scores from screening instruments is scarce. Bedside cognitive screening holds potential to contribute, but needs prospective validation. Evidence is scarce for S-100B levels and lacking for measures derived from EEG and MRI.

Prognostication and shared decision making in neurocritical care

Kelsey Goostrey, ¹ Susanne Muehlschlegel ^{1,2,3}

: BMJ 2022;377:e060154

Uncertainty

Uncertainty is perhaps the greatest challenge of prognosticating in the neuroICU and is represented by the confidence intervals around the probability of a predicted outcome. It is always inherently present. For example, outliers exist even in large population based studies that have an unexpectedly good or poor outcome. A recently described taxonomy of uncertainty in neurocritical care included several types of uncertainty: diagnostic, prognostic, experiential, moral, value, and ethical. 46

Guidelines

No guidelines exist on prognostication or SDM in neurological emergencies. A recent gap analysis

Ci sono valori universalmente condivisi?

• Art 2: ostinazione medica (ex accanimento terapeutico)

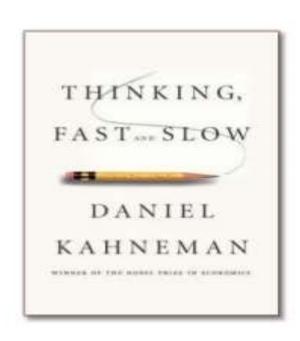

Nei casi di paziente con prognosi **infausta** a breve termine o di **imminenza** di morte, il medico deve astenersi da ogni ostinazione **irragionevole** nella somministrazione delle cure e dal ricorso a trattamenti **inutili o sproporzionati.**

E io? Le mie sicurezze?

- "L'illusione di avere capito il passato alimenta l'ulteriore illusione di poter prevedere e controllare il futuro. Queste illusioni sono confortanti. Riducono l'ansia che proveremmo se permettessimo a noi stessi di riconoscere in pieno le incertezze dell'esistenza."
- "I veri esperti conoscono i limiti della loro conoscenza. Vi sono molti pseudoesperti i quali non si rendono minimamente conto di non sapere quello che fanno (l'illusione di validità) e che, in generale, la sicurezza soggettiva è spesso troppo grande e troppo poco informativa."

Gli altri. Medici e infermieri del reparto e di altri reparti

• Le decisioni relative all'end-of-life in ICU sono comuni e difficili. Spesso generano conflitti, o fenomeni quali l'effetto cascata (per evitare i contrasti) o la polarizzazione (cercare i contrasti).

Curiosità del giorno:
sapecvate che si possono avere
opinioni differenti senza doversi
odiare?
Si chiama intelligenza.

Davvero un problema frequente?

Prevalence and Factors of Intensive Care Unit Conflicts

The Conflicus Study

Élie Azoulay¹, Jean-François Timsit², Charles L. Sprung³, Marcio Soares⁴, Kateřina Rusinová⁵, Ariane Lafabrie¹,

Am J Respir Crit Care Med Vol 180. pp 853-860, 2009

main reported sources of conflict were general behaviors (Figure 2A) and end-of-life care (Figure 2B). Among general behaviors perceived as causing conflicts, the most common were personal animosity, mistrust, and poor communication within the ICU team. The main perceived sources of conflict related to end-of-life care were lack of psychological support, absence of unit-level meetings, and problems with the decision-making process.

Teamwork refers to the

Knowledge, skills and attitudes (KSA)

that facilitate a coordinated, adaptive, effective performance.

Knowledge, skills and attitudes

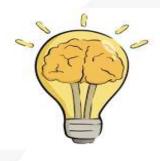

LA RIVOLUZIONE DEI SISTEMI

Team/Collective	Propensity to take other's behav- ior into account during group interaction and the belief in the importance of team goals over individual member's goals		Taking into account alternative solutions provided by teammates and appraising that input to determine what is most correct
Orientation			Increased task involvement, information sharing, strategizing, and participatory goal setting
Shared Mental Models	An organizing knowledge struc- ture of the relationships between the task the team is engaged in and how the team members will interact	=	Anticipating and predicting each other's needs Identify changes in the team, task, or team- mates and implicitly adjusting strategies as needed
Mutual Trust	The shared belief that team members will perform their roles and protect the interests of their teammates	=	Information sharing Willingness to admit mistakes and accept feedback

- Bandire con gentilezza le certezze assolute
- Capacità di includere, di mediare le posizioni, o di cercare mediazione. Attenzione a non creare vincitori o sconfitti: tutti devono sentire le decisioni come un risultato comune
- Spesso il quadro si chiarisce nel tempo
- Documentare le decisioni
- Debriefing se possibile, almeno nei casi contrastati

Il paziente, la sua famiglia

Ricordiamoci l'obiettivo: comprendere i valori e le preferenze del paziente (ad es.: le DAT?).

- Creiamo una relazione, non un singolo episodio.
- Trasparenza, coerenza, empatia, pazienza, mediazione. Ascolto, ascolto, ascolto (VALUE).
- Flessibilità, disponibilità a trial di full treatment.
- Attenzione alle diversità culturali nei valori e nelle relazioni. Attenzione alle famiglie "non tradizionali". Attenzione alla fluidità/assenza di valori, magari cristallizzati solo all'atto del colloquio.
- Attenzione al paziente pediatrico.
- Gestione corretta dei conflitti.
- Non lasciare sola la famiglia nemmeno dopo.

End of Life Decision-Making Climate Model (Van den Bulcke et al., 2018)

The strong ethical components to decision making are particularly influenced by cultural and organisational norms prevalent within environments in which they are made e.g. interactions between patients, clinicians and potential influence from unit leaders. This has been described as a Decision-Making Climate (Van den Bulcke et al., 2018).

Dying with Dignity in the Intensive Care Unit

LA RIVOLUZIONE DEI SISTEMI

N Engl J Med 2014;370:2506-14.

CONCLUSIONS

Palliative care in the ICU has come of age. Its guiding principles are more important than ever

in increasingly pluralistic societies. Ensuring that patients are helped to die with dignity begs for reflection, time, and space to create connections that are remembered by survivors long after a patient's death. It calls for humanism from all clinicians in the ICU to promote peace during the final hours or days of a patient's life and to sup-

port the bereaved family members. Ensuring death with dignity in the ICU epitomizes the art of medicine and reflects the heart of medicine. It demands the best of us.
