Blood on Field?

Quesito 12: Qual è il miglior fluido per l'espansione volêmica da utilizzare nella rianimazione in corso di shock emorragico?

Raccomandazione 23. Nel paziente traumatizzato con emorragia si raccomanda in sede pre-ospedaliera l'utilizzo dei cristalloidi per il recupero della volemia, se gli emocomponenti non sono disponibili [Raccomandazione forte, qualità delle prove bassa].

Raccomandazione 22. Nel paziente traumatizzato con emorragia in sede pre-ospedaliera, quando possibile, considerare la trasfusione di emocomponenti [Raccomandazione condizionata, qualità delle prove bassa].

The COAST score (Coagulopathy of Severe Trauma score) >3

Variable	Value	Score
Entrapment	Yes	1
Systolic Blood Pressure	<100 mmHg	1
	<90 mmHg	2
Temperature	< 35C	1
	< 32 C	2
Suspected Chest Trauma	Yes	1
Suspected intra-abdominal or pelvic trauma	Yes	1

The COAST score: Coagulopathy in Severe Trauma

The Bottom Line

- The PATCH trial supports the findings of CRASH-2 in that prehospital TXA reduces early death due to haemorrhage in major trauma patients
- However, there are more survivors with poor neurological outcome in the TXA group. This clearly has an impact on patient's quality of life, implications for family and economic implications for a society caring for highly dependent people
- I think on the balance of things, prehospital TXA should continue to be used in patients with major trauma at risk of coagulopathy
- Longer term outcomes would also add to interpretation of this trial

7. Centralizzazione!

Italian
Resuscitation
Council

Criteri di Centralizzazione «PreHospital Field Triage»

GRADO A: instabili nonostante la rianimazione

- Pressione sistolica arteriosa < 90 mmHg nonostante l'utilizzo di farmaci vasopressori e più di 1 litro di soluzioni cristalloidi e/o trasfusioni pre-ospedaliere
- SpO2 < 90% nonostante l'utilizzo di ventilazione meccanica o l'utilizzo di maschere facciali ad alto flusso

GRADO B: stabilizzato dopo la rianimazione preospedaliere o criteri anatomici

- Pressione sistolica > 90 mmHg o SpO2 >90% dopo una resuscitazione iniziale
- Lesione cerebrale traumatica isolata con GCS< 13 o GCS sulla risposta motoria <5
- Sospetto di trauma del midollo spinale
- Fratture toraciche multiple e volet costale
- Trauma pelvico severo
- Ferita penetrante
- Amputazione o arto schiacciato

GRADO C: stabile con situazione in potenziale evoluzione o anamnesi medica a rischio

- Caduta da più di sei metri
- Vittima di esplosione o eiettata
- Decesso del passeggero accanto
- Valutazione della velocità: deformazione della vettura, no cintura di sicurezza, no casco
- Anamnesi medica: <5 anni o > 65 anni, in gravidanza, disordini di coagulazione

Gravi & Instabili

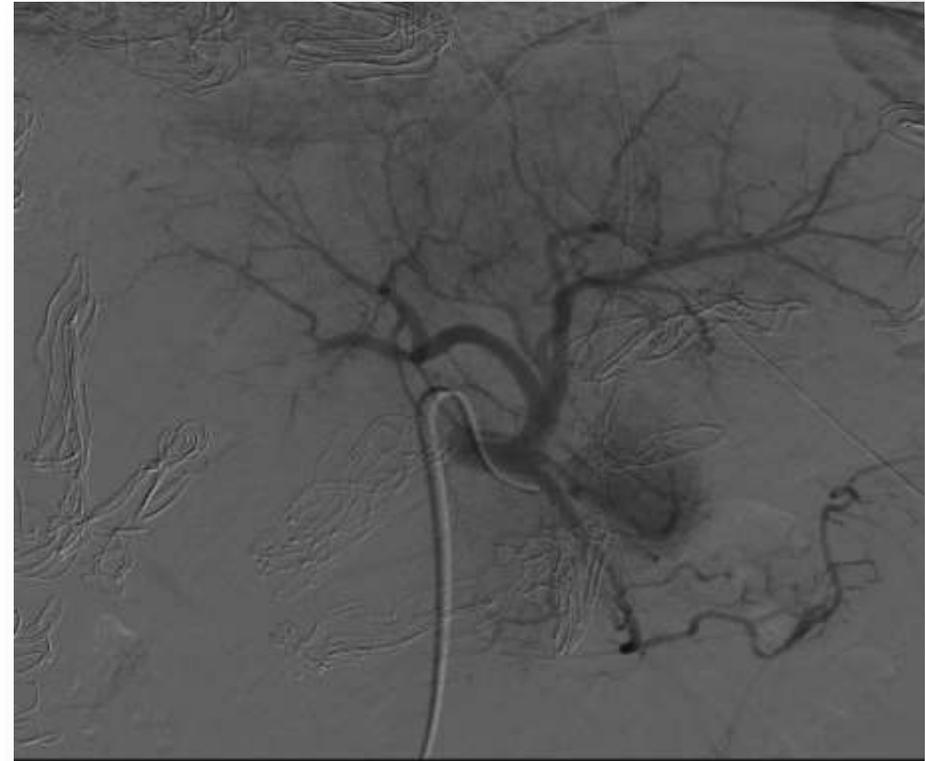

Gravi & Stabili o
Stabilizzati

NON Gravi &
Stabili

Nel sistema TRENAU:

- (1) i pazienti con **grado A** vengono destinati al *trauma center di I, II, III livello piu' vicino*, in caso di sosta tecnica al III livello sono trasferiti piu' rapidamente possibile ai livelli superiori;
- (2) i pazienti con **grado B** vengono avviati al *trauma center di I livello se con GCS<9 o lesione midollare*, al trauma center di I o II livello negli altri casi;
- (3) i pazienti con **grado C** vengono *indifferentemente* destinati ai trauma center di I,II o III livello

...more soldiers were killed in WWII by pentothal than bullets.

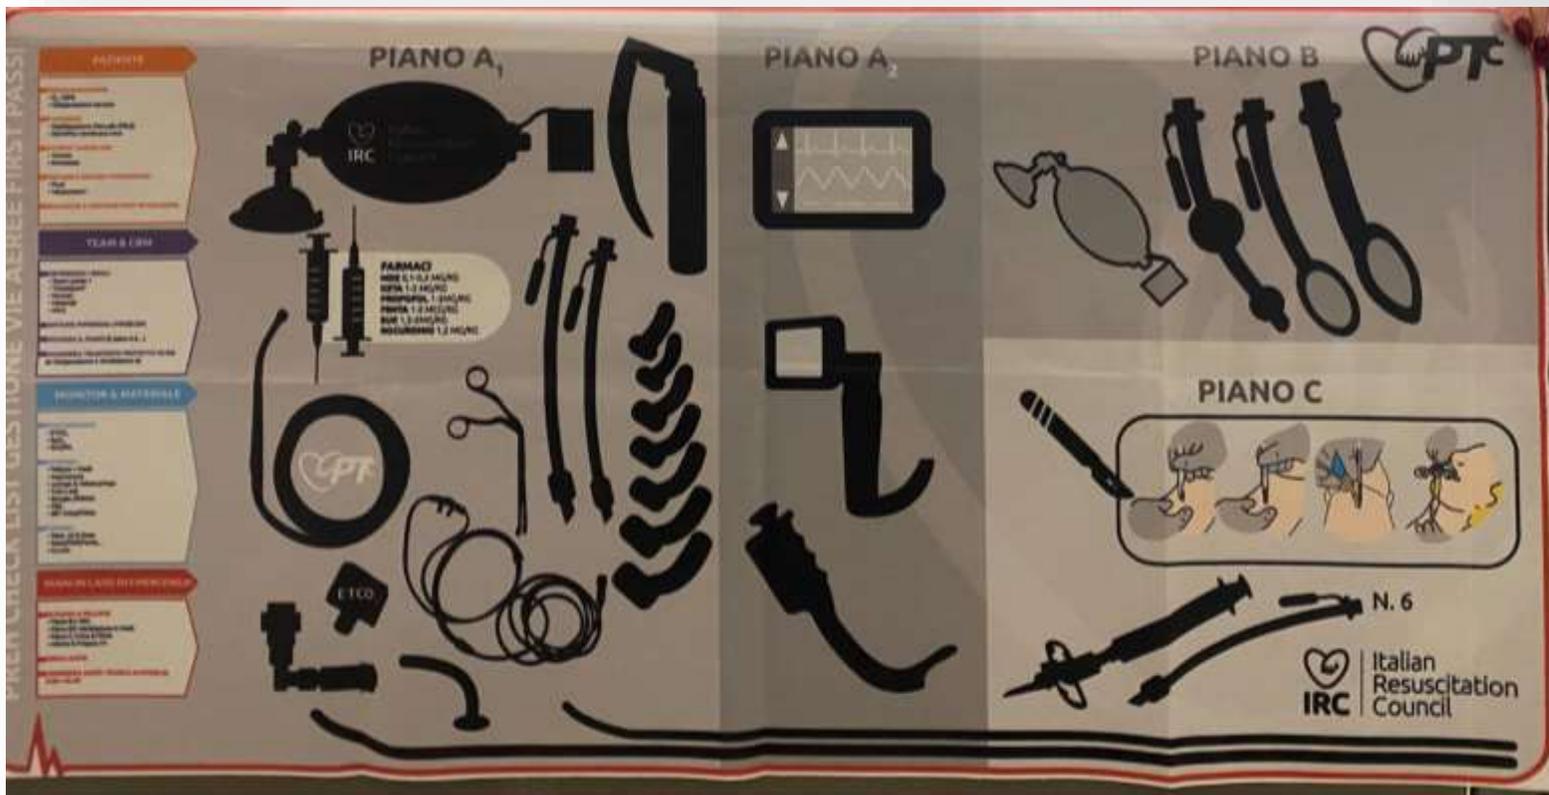

Drug or Dosage: What is the Important Factor?

It has been frequently said that **more** soldiers were killed in World War II by **pentothal** than by bullets. Indeed, Halford³⁶ wrote a compelling negative critique of the use of **pentothal** following the Pearl Harbor experience. In the same volume of *Anesthesiology*, however, appeared a case report by Adams and Gray³⁷ (and an accompanying editorial) revealing that **pentothal** was not the lethal factor but rather the *dosage* that was typically administered to the traumatized patient.

In general, severely ill patients should not receive **pentothal** or propofol for induction. If the patient is comatose upon arrival of the airway expert to the resuscitation scene, no drug other than oxygen and possibly a neuromuscular blocking drug is required until the patient's blood pressure and heart rate indicate that he or she can tolerate hypnotic agents.
